

# 16th STS-AIChE Southwest Process Technology Conference

▶ **Chemical Loading and Unloading:  
*Risks at the Intersection of the Truck  
Driver and the Facility***

---

▶ **Nick Reding, PhD, PE, CFEI**

---

▶ **Exponent, Inc.**

---

**Sept 22-23, 2025, University of Houston**

# Speaker Bio: Nick Reding, PhD, PE, CFEI

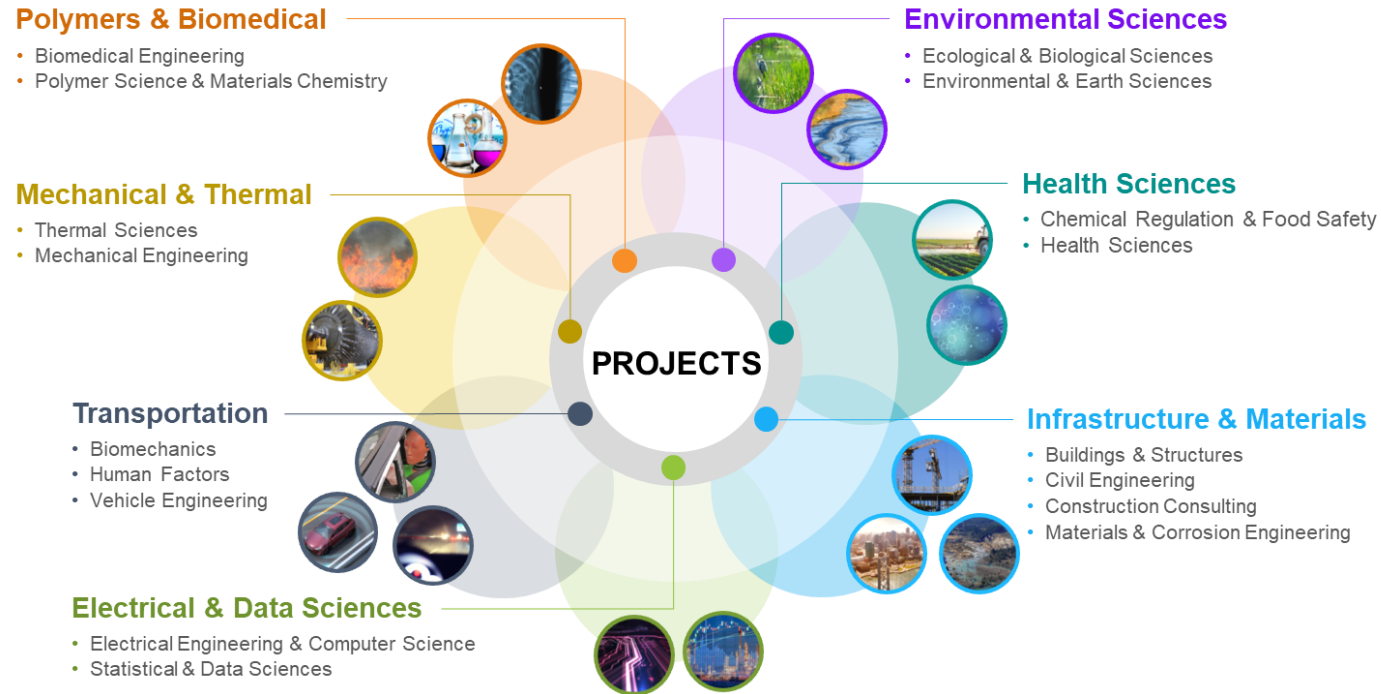

---

- Managing Engineer in Thermal Sciences Practice
  - Investigate chemical process incidents
    - Chemical releases
    - Fires and explosions
  - Analyses of chemical process failures
    - Failure to meet performance guarantees or technical specifications
    - Construction, cold/hot commissioning, start up, performance testing, handover, turnaround, steady-state, non-routine operations
- AIChE member for >5 years

# Engineering and Scientific Consulting at Exponent

# Statistics on Chemical Incidents

---

- Approximately 80% of chemical safety or near-miss incidents occur during non-routine operations
- Process Hazard Analyses (PHA) of continuous operations may catch a small fraction of hazards associated with non-routine operations
  - AIChE Hazard Analysis book now requires hazard analysis for any non-routine operations
- Motivates continuous learning and process safety management for non-routine operations (i.e., **chemical loading/unloading**)

# Outline

**Loading & Unloading Procedure**

**Truck Driver Responsibility**

**Facility Responsibility**

**The Intersection**

# Applicable Codes & Standards

---

- **NFPA 30: Flammable and Combustible Liquids Code**
  - **Ch. 18:** Dispensing, Handling, Transfer, and Use of Ignitable (Flammable or Combustible) Liquids
  - **Ch. 28:** Bulk Loading and Unloading Facilities for Tank Cars and Tank Vehicles
- **NFPA 77: Recommended Practice on Static Electricity**
  - **Ch. 12:** Static Electricity Hazards of Liquids in Bulk Storage Tanks and in Tank Vehicles

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information intended for internal use by Exponent, Inc., its employees, and clients.

# Applicable Codes & Standards

---

- **NFPA 400: Flammable and Combustible Liquids Code**
  - This code shall apply to the storage, use, and handling of hazardous materials, such as:
    - Ammonium nitrate solids and liquids
    - Corrosive solids and liquids
    - Flammable solids
    - Toxic and highly toxic solids/liquids

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information intended for internal use by Exponent, Inc., its employees, and clients.

# Applicable Codes & Standards

---

- **OSHA Process Safety Management (PSM) standards**

- Communication: 29 CFR 1910.1200
- Highly hazardous chemicals: 29 CFR 1910.119
- Flammable liquids: 29 CFR 1910.106
- Control of hazardous energy: 29 CFR 1910.147
- Loading and unloading guidance: 49 CFR 177.834

- **Department of Transportation (DOT) enforced**

- Hazardous Materials Regulations (HMR): 49 CFR Parts 171-180

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information intended for internal use by Exponent, Inc., its employees, and clients.

# Chemical Loading and Unloading

- The loading and unloading of chemical materials is a critical point in the supply chain where shared responsibility exists between both the truck driver and the facility share responsibility for safety.
- Potential hazards can be magnified if proper procedures and communication are not in place.

## Top Loading vs. Bottom Loading

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information intended for internal use by Exponent, Inc., its employees, and clients.

# The 4 Most Common Scenarios for Truck (Un)loading

---

## 1. Bottom unloading by pump and vapor return

### Advantages:

- In an emergency, power to the pump is cut, immediately stopping pump flow.
- Vapor in the site tank will flow to the truck and not be lost to the atmosphere.

### Disadvantages:

- Connecting the vapor return usually requires access to the top of the vehicle, except for ground-operated trucks.

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information. It is not to be distributed outside of the intended audience. This notice is not intended to constitute an offer of insurance or any other financial product. For more information, please contact your broker.

Best Practice Guidelines for Safe (Un)Loading of Road Freight Vehicles Covering Technical, Behavioral and Organizational Aspects, Issue 1.0, December 2013.

# The 4 Most Common Scenarios for Truck (Un)loading

## 1. Bottom unloading by pump and vapor return

### Advantages:

- In an emergency, power to the pump is cut, immediately stopping pump flow.
- Vapor in the site tank will flow to the truck and not be lost to the atmosphere.

### Disadvantages:

- Connecting the vapor return usually requires access to the top of the vehicle, except for ground-operated trucks.

## 2. Bottom discharge by pump without vapor return

### Advantages:

- In an emergency, power to the pump is cut, immediately stopping pump flow.

### Disadvantages:

- Opening the vapor valve usually requires access to the top of the site's tank (tank vapor out) and the vehicle (air in), except for ground-operated trucks.
- Vehicle tanks lack proper vacuum protection for discharge and can be damaged if vacuum collapse is not managed.

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information. It is not to be distributed outside of the intended audience. It is subject to change without notice. © 2013 Exponent, Inc.

# The 4 Most Common Scenarios for Truck (Un)loading

---

## 3. Bottom unloading by compressed air or inert gas

### Advantages:

- Without a pump, cleanliness is not a concern, and the compressor does not contact the product, minimizing contamination risk.

### Disadvantages:

- Vehicle tanks remain pressurized after discharge; compressor connection usually required top access unless it is a ground-operated truck.
- Site tank vapors must be considered in the process.

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information. It is not to be distributed outside of Exponent, Inc. without prior written approval. # The 4 Most Common Scenarios for Truck (Un)loading

## 3. Bottom unloading by compressed air or inert gas

### Advantages:

- Without a pump, cleanliness is not a concern, and the compressor does not contact the product, minimizing contamination risk.

### Disadvantages:

- Vehicle tanks remain pressurized after discharge; compressor connection usually required top access unless it is a ground-operated truck.
- Site tank vapors must be considered in the process.

## 4. Top discharge

### Advantages:

- With no openings below the liquid level, the risk of unauthorized access or contamination is greatly reduced.

### Disadvantages:

- Access to the top of the vehicle is required.

# Road Truck vs. Railcar (Un)loading

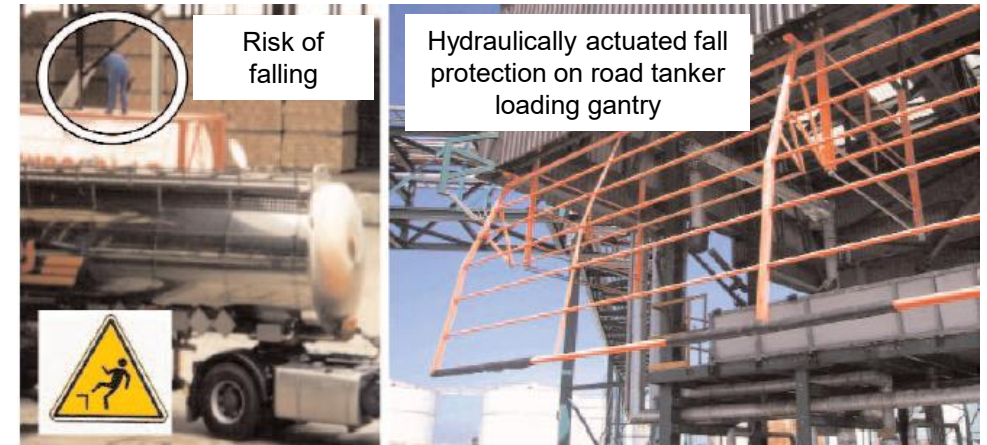

---

Considerations	Road Trucks or Tankers	Railcars
<b>Grounding</b>	Requires explicit bonding	Grounded via rail infrastructure
<b>Loading Access</b>	Gantries needed; driver less involved	Specialized arms/platforms; operator-led
<b>Loading Method</b>	Bottom or top loaded; splash risk, additional controls needed	Often bottom loading; strong safety integration
<b>Infrastructure</b>	Simple hoses and valves	Complex systems: EFVs, ESDVs, vapor systems, etc.
<b>Flow &amp; Duration</b>	Shorter, smaller volumes	Larger volumes, longer stays
<b>Operator Role</b>	Driver detached; plant staff in PPE	Trained staff perform the operation

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information intended for internal use by Exponent, Inc., its employees, and clients.

# Examples of Inherent Risks for (Un)loading Operations

- Chemical exposure (spills and leaks)
- Overfills
- Equipment failures
- Fires and explosions
- Falls and physical injuries
- Vehicle accidents
- Drive-aways
- Environmental contamination

Chocks located beneath wheels of rail truck to prevent drive-away.

Loading & Unloading Procedure

**Truck Driver Responsibility**

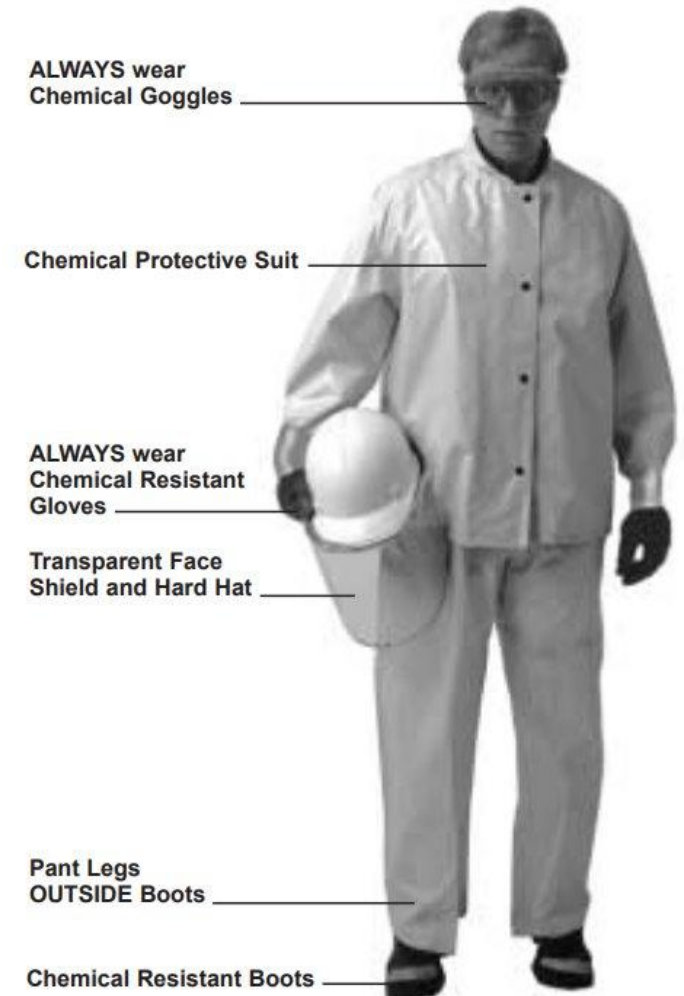

Facility Responsibility

The Intersection

# Truck Driver Responsibilities

---

- **Vehicle Inspection**: Conduct pre-trip and post-trip inspections, verifying the tanker's condition, including labels, placards, seals, and gaskets
- **Safety Equipment**: Ensure all required personal protective equipment (PPE) is worn, such as eye protection, gloves, and respiratory protection, depending on the chemical being handled
- **Site Preparation**: Secure the vehicle, chock the wheels, and ensure the area is clear of obstacles or unnecessary personnel

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information intended for internal use by Exponent, Inc., its employees, and clients.

# Truck Driver Responsibilities

- **Loading/Unloading Procedures:**

- Verifying the chemical matches the shipping documents
- Connecting hoses and grounding/bonding equipment correctly
- Loading or unloading at a slow, controlled rate
- Monitoring the process closely for leaks or other issues
- Ensuring proper ventilation during loading
- Monitoring volume to prevent overfills

- **Communication:** Communicate effectively with facility personnel regarding safety procedures, potential hazards, and any other issues

- **Emergency Response:** Be prepared to respond to spills or leaks, using appropriate containment and cleanup measures

- **Documentation:** Complete all required paperwork

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information intended for internal use by Exponent, Inc., its employees, and clients.

Loading & Unloading Procedure

Truck Driver Responsibility

Facility Responsibility

The Intersection

# Facility Responsibilities

---

- **Trained Personnel**: Ensure all workers involved in loading and unloading operations are trained in safety procedures, equipment function, and emergency protocols
- **Safety Equipment**: Provide and maintain appropriate PPE, spill containment equipment (e.g., absorbent materials, booms), and fire suppression systems
- **Safe Loading Area**: Ensure the loading/unloading area is secure, well-ventilated, equipped with spill containment, and free of hazards
- **Standard Operating Procedures (SOPs)**: Develop and implement comprehensive SOPs for each chemical handled, outlining safe procedures for loading, unloading, and emergency response

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information intended for internal use by Exponent, Inc., its employees, and clients.

# Facility Responsibilities

- **Equipment Maintenance**: Regularly inspect and maintain all loading/unloading equipment (hoses, pumps, valves) to ensure safe and working condition
- **Chemical Compatibility**: Verify the compatibility of the tanker, receiving container, and equipment with the chemical being transferred
- **Supervision and Monitoring**: Ensure a qualified person is present and attentive during the entire loading/unloading process, maintaining an unobstructed view and the ability to stop the operation if needed
- **Security**: Implement measures to prevent unauthorized access to hazardous materials
- **Documentation**: Maintain accurate records of loading/unloading operations and any incidents (or near-misses) that had occurred

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information intended for internal use by Exponent, Inc., its employees, and clients.

# Outline

$x$

**Loading & Unloading Procedure**

**Truck Driver Responsibility**

**Facility Responsibility**

**The Intersection**

# The Intersection

- **Collaboration and Communication**: Communicate openly and frequently to ensure a shared understanding of procedures, potential hazards, and emergency plans
- **Pre-Loading/Unloading Checklist**: Use checklists to confirm all safety procedures have been followed before starting and after completing the operation
- **Training and Education**: Provide regular and ongoing training for both truck drivers and Facility personnel on safe handling procedures, hazard identification, and emergency response
- **Hazard Identification and Risk Assessment**: Thoroughly assess potential hazards associated with each chemical and loading/unloading operation
- **Emergency Preparedness**: Develop and regularly practice emergency response plans and ensure adequate resources are available for spill containment, cleanup, and first aid

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information intended for internal use by Exponent, Inc., its employees, and clients.

# Know the Hazard: *Flammable Liquids*

- **When handling combustible liquids:**
  - Connect a grounding interlock to prevent static discharge from igniting the liquid
  - Avoid overfilling and ensure the tank is properly vented to prevent collapse.
- **Before unloading:**
  - Verify the chemical matches the storage tank to avoid cross-contamination.
  - Open discharge valves slowly and only unload from two compartments at a time.
- **After unloading:**
  - Seal or close all valves and compartments.
  - If highly volatile liquids, consider engaging a vapor recovery system.

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information intended for internal use by Exponent, Inc., its employees, and clients.

# Know the Hazard: *Caustic Solutions*

- **When handling caustic solutions:**
  - In addition to minimum PPE, tank truck operators should wear:
    - chemical protective suit
    - hard hat with full face shield
    - chemical resistant boots are required when handling hoses
- **Before unloading:**
  - Unloading operator should verify the location of all fittings before unloading.
  - Have spill containment materials, like track pans, available in the unloading area
- **After unloading:**
  - Water must be available to wash out and dilute any caustic soda remaining in unloading hose.

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information intended for internal use by Exponent, Inc., its employees, and clients.

# Case Study: *MGP Ingredients Chlorine Release*

---

October 21, 2016

- 4,000 gallons of 30% **sulfuric acid** was unloaded from tanker truck into a tank containing 5,850 gallons of **sodium hypochlorite**.
- The resulting reaction released approximately 3,490 lbs of chlorine gas - 11,000 people were forced to evacuate the community.

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information. It is for internal use only and is not to be distributed outside of Exponent, Inc., its employees, and clients.

Key Lessons for Preventing Inadvertent Mixing During Chemical Unloading Operations, GSB, 2016-01-14, 10/26/2017

# Incident Timeline

- Driver arrived, operator unlocked the cap on the **sulfuric acid** fill line and identified it to the driver.
- Operator left the area before the driver had connected the hose.
- Driver connected the hose to the unlocked **sodium hypochlorite** line, opened the valve, and returned to cab of the truck during transfer.
- Driver noticed the gas plume form and was unable to access shut-off valves before evacuating.
- Without automatic shutdown, sulfuric acid filled the sodium hypochlorite tank until first responders shut down the transfer.

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information intended for internal use by Exponent, Inc., its employees, and clients.

# What Went Wrong...

**Operating procedures and work practices were not aligned**

**Operator did not verify the correct connection had been made and open the fill line valve**

**Driver did not carefully check that the connection was made to the correct vessel and continuously monitor the transfer**

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information intended for internal use by Exponent, Inc., its employees, and clients.

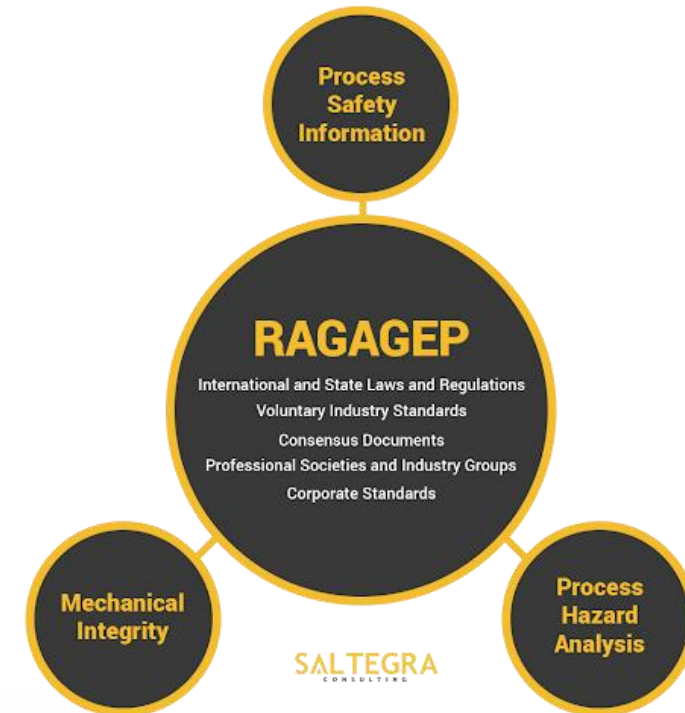

# Process Safety Takeaways?

# Process Safety Learnings with Chemical Transfers

- Approach chemical transfers (non-steady-state) as you would steady-state operations
  - Know the hazards
  - Consider **RAGAGEP**s/industry practices
  - Design the process to minimize the risk
- Chemical transfers are heavily dependent on human operators
  - Understand the human factors involved and ways to reduce the possibility of error
- Where is the intersection between truck driver and the Facility?
  - **Regular PHAs and audits on risk**

**Confidentiality Notice:** This presentation is in draft and contains privileged and confidential information intended for internal use by Exponent, Inc., its employees, and clients.
